

Mercury Fleet Management (MPS) "TOP NEWS"

- Enhanced graphical report for marker supplies
- Additional management of waste toner

Up to now, with the definition of so-called 'thresholds', toner consumption has been measured and monitored by corresponding alert rules. The automated notification of downstream service processes by these is only one of the versatile capabilities of the Mercury Fleet & Service Management System.

From now on, the configured thresholds for the alert rules, can be used not just for the remaining fill of a toner cartridge, but also for the remaining capacity of waste toner, drain bottles, etc.

Thus, the scope in managing printer supplies will be significantly expanded. In addition, all the supply levels are displayed by using a new, graphical web based GUI. Detailed bar charts give fast and clear information about the remaining fill or current level. The display is sorted by colour of the individual cartridges and shows percentage values of filling.
