

Mercury Fleetmanagement (MPS) "TOP NEWS"

- New report for capacity utilisation for the monitored devices

Previously, the Mercury Fleet & Servicemanagement Software has been able to create reports on meter readings and click volume for user-defined dates and time periods and provide information about the performed prints, copies, faxes, scans, etc. to the dealers and customers.

From now on, the software can also provide information about capacity utilisation of the monitored devices and present them in a separate graphical report. Based on the manufacturer's data about nominal print capacity, entered in the MPS software, and the meter readings reported from the printing systems, the capacity utilisation, based on time and printing behavior of the users, is calculated on demand for any desired time period and colour co-ordinated presented for each monitored device.

Thus docuFORM has expanded again the possibilities in managing printing- and multifunctional systems with the MPS software significantly.

Printer	S/N	I/N	Model	Period	Monthly print volume - nominal	Monthly print volume - real	%	Relation to nominal value = 100%
